

Boom Systems

For HSI Crusher Installations

PRODUCTION INCREASING TECHNOLOGY

Whether it be a new installation or a retro fit Tecman Horizontal Shaft Impact Crusher rock breaker boom systems can be custom designed to fit your requirements.

The revolutionary Tecman Integrate Column System complete with integrated power pack allows the boom system to be perfectly aligned with the jaw giving optimal boom geometry for the removal of blocking or bridging material with ease.

The state of the art Tecman OPTIME control systems also allows Tecman Boom Systems to automatically go to work and park positions with one touch. This means installations can be positioned in areas where the operator risks damaging structures to position the boom, but are optimal for operation with little to no risk.

But the most important feature is that you do not have to stop your crusher to clear bridging and blocking material as Tecman HSI Crusher Boom Systems can be calibrated to work safely within 500mm (20 inches) of the rotor. The seamlessly clears all blockages in minutes.
